MINKOWSKI PENALTIES

Differentiable Geometric Constraint Enforcement Jiří Minarčík, Sam Estep, Wode Ni, Keenan Crane

How to optimize two shapes so that they don't overlap?

We use signed distance function (SDF)

$$\phi_C(\mathbf{x}) := \begin{cases} -d(\mathbf{x}, \partial C) & \mathbf{x} \in C, \\ d(\mathbf{x}, \partial C) & \mathbf{x} \notin C. \end{cases}$$

OVERLAPPING $\mathcal{P}_o(A, B) = \max(0, \phi_C(\mathbf{0}))$ **NON-OVERLAPPING**

How to minimize this energy?

 c_3

Exterior point method:

Individual problems solved using L-BFGS with step size given by a line search strategy.

of Minkowski difference C = B - A

 $B - A = \{\mathbf{a} - \mathbf{b} \colon \mathbf{a} \in A, \mathbf{b} \in B\}.$

Given a set of Minkowski penalties \mathcal{P}_i and additional energy functionals \mathcal{E}_i we aim to solve the following problem:

$$\min_{\mathbf{p}\in\mathbb{R}^m}\sum_{i=1}^k \mathcal{E}_i(\mathbf{p}) \quad \text{s.t.} \quad \sum_{i=1}^l \mathcal{P}_i(\mathbf{p}) = 0.$$

$$\mathcal{P}_{d}(A, B) = -\min(0, \phi_{C}(\mathbf{0}))$$

$$TANGENT$$

$$\mathcal{P}_{t}(A, B) = |\phi_{C}(\mathbf{0})|$$

$$NESTED$$

$$\mathcal{P}_{c}(A, B) = \mathcal{P}_{d}(A, B^{c})$$
...

Gradients are computed using autodif engine Rose. Shapes are approximated by polygons and their Minkowski sum is computed using reduced convolution. For rigit translations, the sum can be precomputed.

Works even for non-convex polygons!
