SIGMA 2024

Motivation

Let $T := \langle p_1, p_2, p_3 \rangle$ be a non-degenerate triangle. The Hammer-Stroud quadrature rules are defined as (Hammer, Stroud MTAC 1956)

- $Q_{HS,2}[f] := \frac{1}{3}|T| (f(t_{1,2}) + f(t_{2,2}) + f(t_{3,2}))$
- $Q_{HS,3}[f] := |T| \left(\frac{25}{48} (f(t_{1,3}) + f(t_{2,3}) + f(t_{3,3})) - \frac{27}{48} f(p_c) \right)$

satisfy

$$Q_{HS,2}[p] = \int_T p, \quad \forall p \in \mathbb{P}_2, \quad \text{and} \quad Q_{HS,3}[p] = \int_T p, \quad \forall p \in \mathbb{P}_3$$

- **?** Is the Hammer-Stroud quadrature rule $Q_{HS,2}$ still exact for the larger space \mathbb{S}_1 , where $\dim(\mathbb{S}_1) > \dim(\mathbb{P}_2)$?
- **?** Is the Hammer-Stroud quadrature rule $Q_{HS,3}$ still exact for the larger space \mathbb{S}_2 , where $\dim(\mathbb{S}_2) > \dim(\mathbb{P}_3)$?

- **?** Is the Hammer-Stroud quadrature rule $Q_{HS,2}$ still exact for the larger space \mathbb{S}_1 , where $\dim(\mathbb{S}_1) > \dim(\mathbb{P}_2)$?
- **?** Is the Hammer-Stroud quadrature rule $Q_{HS,3}$ still exact for the larger space \mathbb{S}_2 , where $\dim(\mathbb{S}_2) > \dim(\mathbb{P}_3)$?

The answer is positive :

Gaussian quadrature for C^1 cubic Clough–Tocher macro-triangles

Jiří Kosinka^{a,*}, Michael Bartoň^b

On numerical quadrature for C^1 quadratic Powell–Sabin 6-split macro-triangles

Michael Bartoň^a, Jiří Kosinka^{b,*}

^a BCMF – Basque Center for Applied Mathematics, Alameda de Mazarredo 14, 48009 Bilbao, Basque Country, Spain

^b Bernoulli Institute, University of Groningen, Nijenborgh 9, 9747 AG, Groningen, The Netherlands

Macro-element splines

Let T_ℓ be a split of a triangle T into ℓ sub-triangles. The spline space of global smoothness r and degree d is defined as:

$$\mathbb{S}_d^r(T_\ell) := \{s \in C^r(T); s|_\Delta \in \mathbb{P}_d \quad \forall \Delta \in T_\ell\}$$

CT-3-split (Clough, Tocher 1965)

$$\#\mathbb{S}_3^1(T_3) = \#\mathbb{P}_3 + 2$$

PS-6-split (Powell, Sabin 1977)

$$\#\mathbb{S}_2^1(T_6) = \#\mathbb{P}_2 + 3$$

Macro-element splines

$$\#\mathbb{S}_3^1(T_3) = \#\mathbb{P}_3 + 2$$

$$\#\mathbb{S}_2^1(T_6) = \#\mathbb{P}_2 + 3$$

- $\mathbb{S}_3^1(T_3) = \mathbb{P}_3 \oplus \{D_1, D_2\}$
 - $D_i \in C^1$, and $D_i|_{\Delta} \in \mathbb{P}_3$
 - $D_i|_{\text{micro-edge}} = 0$, & $\int_T D_i = 0$
- Bartoň, Kosinka 2019

- $\mathbb{S}_2^1(T_6) = \mathbb{P}_2 \oplus \{D_1, D_2, D_3\}$
 - $D_i \in C^1$, and $D_i|_{\Delta} \in \mathbb{P}_2$
 - $D_i|_{\text{micro-edge}} = 0$, & $\int_T D_i = 0$
- Bartoň, Kosinka 2019

$$\#S_3^1(T_3) = \#\mathbb{P}_3 + 2$$

$$\#S_2^1(T_6) = \#\mathbb{P}_2 + 3$$

- $S_3^1(T_3) = \mathbb{P}_3 \oplus \{D_1, D_2\}$
- $D_i \in C^1$, and $D_{i|\Delta} \in \mathbb{P}_3$
- $D_{i|micro-edge} = 0$, & $\int_T D_i = 0$
Bartoň, Kosinka 2019

- $S_2^1(T_6) = \mathbb{P}_2 \oplus \{D_1, D_2, D_3\}$
- $D_i \in C^1$, and $D_{i|\Delta} \in \mathbb{P}_2$
- $D_{i|micro-edge} = 0$, & $\int_T D_i = 0$
Bartoň, Kosinka 2019

This technique cannot be generalized to cases involving high degrees or multiple variables.

Let:

- $V_1, \dots, V_{d+3} \in \mathbb{R}^2$ be a sequence of knots.
- $V = \{V_1, \dots, V_{d+3}\} \subset \mathbb{R}^2$.
- $\Theta = \langle \widehat{V}_1, \dots, \widehat{V}_{d+3} \rangle$ be a simplex in \mathbb{R}^{d+2} .
- $\Pi : \mathbb{R}^{d+2} \rightarrow \mathbb{R}^2$ be the projection of Θ into \mathbb{R}^2 satisfies

$$\Pi(\widehat{V}_i) = V_i, \quad i = 1, \dots, d+3.$$

The unit integral bivariate simplex S_V can be defined geometrically as follows

$$S_V(x) := \frac{\text{vol}_2(\Theta \cap \Pi^{-1}(x))}{\text{vol}_{d+2}(\Theta)}$$

Simplex spline

The simplex S_V meets some useful properties:

- S_V is a non-negative spline of degree $\leq d$ and support $\langle V \rangle$.
- For $d = 0$ we have

$$S_V = \begin{cases} \frac{1}{\text{Area}(\langle V \rangle)}, & \text{if } x \in \langle V \rangle^\circ, \\ 0, & \text{if } x \notin \langle V \rangle^\circ, \end{cases}$$

- *Local smoothness*: The simplex S_V is $C^{d+1-\mu}$ continuous across a knot line, where μ is the number of knots including multiplicity on that knot line.

$p[\ell] := p$ is repeated ℓ times.

Simplex spline

The simplex S_V meets some useful properties:

- S_V is a non-negative bivariate piecewise polynomial of total degree $\leq d$ and support $\langle V \rangle$.
- For $d = 0$ we have

$$S_V = \begin{cases} \frac{1}{\text{Area}(\langle V \rangle)}, & \text{if } x \in \langle V \rangle^\circ, \\ 0, & \text{if } x \notin \langle V \rangle^\circ, \end{cases}$$

where $\langle V \rangle^\circ$ marks the open convex hull of the knots sequence V .

- *Local smoothness*: The simplex S_V is $C^{d+1-\mu}$ continuous across a knot line, where μ is the number of knots including multiplicity on that knot line.
- A normalized simplex spline is defined by:

$$N_V := \frac{\text{Area}(V)}{\binom{d+2}{2}} S_V$$

Simplex spline: Knot insertion

For any $p \in \mathbb{R}^2$, and any $\beta_1, \dots, \beta_{d+3} \in \mathbb{R}$ such that $p = \sum_{i=1}^{d+3} \beta_i p_i$, $\sum_{i=1}^{d+3} \beta_i = 1$, it holds

$$N_{[p_1, \dots, p_{d+3}]} = \sum_{i=1}^{d+3} \beta_i N_{[p_1, \dots, p_{d+3}, p] \setminus p_i}$$

Examples:

- 1D:

$$N_{[0[3],1]} = \frac{2}{3} N_{[0[2],\frac{1}{3},1]} + \frac{1}{3} N_{[0[3],\frac{1}{3}]}$$

Simplex spline: Knot insertion

For any $p \in \mathbb{R}^2$, and any $\beta_1, \dots, \beta_{d+3} \in \mathbb{R}$ such that $p = \sum_{i=1}^{d+3} \beta_i p_i$, $\sum_{i=1}^{d+3} \beta_i = 1$, it holds

$$N_{[p_1, \dots, p_{d+3}]} = \sum_{i=1}^{d+3} \beta_i N_{[p_1, \dots, p_{d+3}, p] \setminus p_i}.$$

Examples:

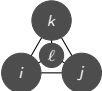

- 2D: $p = \alpha_1 p_1 + \alpha_2 p_2 + \alpha_3 p_3$,

$$N_{[p_1[4], p_2[2], p_3[3]]} = \alpha_1 N_{[p_1[3], p_2[2], p_3[3], p]} + \alpha_2 N_{[p_1[4], p_2, p_3[3], p]} + \alpha_3 N_{[p_1[4], p_2[2], p_3[2], p]}$$

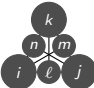

Simplex spline: Notation

Let $T = \langle p_1, p_2, p_3 \rangle$ represent a non-degenerate triangle, where $p_c = \frac{p_1 + p_2 + p_3}{3}$ denotes the barycenter of T , and $p_{ij} = \frac{p_i + p_j}{2}$ represents the midpoint of the edge $\langle p_i, p_j \rangle$. The following notation is considered:

- CT-3-split:

$$:= N_{[p_1[i], p_2[j], p_3[k], p_c[\ell]]}$$

- PS-6-split:

$$:= N_{[p_1[i], p_2[j], p_3[k], p_{1,2}[\ell], p_{2,3}[m], p_{3,1}[n]]}$$

Symmetric quadrature rules

Here we are interested in integrals of the form

$$\int_T f(x) dx,$$

where f is a given function on the triangle T . Let $n \in \mathbb{N}$, $n > 0$ and a function space \mathbb{S} be given. We denote by

$$Q_{n,\mathbb{S}}(f) := \text{Area}(T) \sum_{i=1}^n \omega_i f(t_i)$$

an n -node QR that is exact for any function in the space \mathbb{S} , i.e.,

$$Q_{n,\mathbb{S}}(f) = \int_T f(x) dx \quad \text{for all } f \in \mathbb{S}.$$

The points $t_i \in T$, are the nodes of $Q_{n,\mathbb{S}}$ and ω_i are the corresponding weights.

Symmetric quadrature rules

A QR $\mathcal{Q}_{n,\mathcal{S}}$ is said to be symmetric if it maintains its properties under rotation around the barycenter and reflection with respect to the medians of the triangle. Namely, if $t(\alpha_1, \alpha_2, \alpha_3)$ is a node of $\mathcal{Q}_{n,\mathcal{S}}$ with the corresponding weight ω , then for every permutation Π of $(\alpha_1, \alpha_2, \alpha_3)$, the node $t_{\Pi}(\Pi(\alpha_1, \alpha_2, \alpha_3))$ is also a node of $\mathcal{Q}_{n,\mathcal{S}}$ with the same weight ω .

- type-0-orbit $t(1/3, 1/3, 1/3)$
- type-1-orbit $t(1 - 2\alpha, \alpha, \alpha)$
- type-2-orbit $t(\alpha, \beta, \gamma = 1 - \alpha - \beta)$ ($\alpha \neq \beta \neq \gamma$)

Symmetric quadrature rules

- type-0-orbit $t(1/3, 1/3, 1/3)$

- type-1-orbit $t(1 - 2\alpha, \alpha, \alpha)$

- type-2-orbit $t(\alpha, \beta, \gamma = 1 - \alpha - \beta)$ ($\alpha \neq \beta \neq \gamma$)

Symmetric quadrature rules

The notation $Q_{[n_0, n_1, n_2], \mathbb{S}}$ represents the QR that uses:

- n_0 type-0 orbits,
- n_1 type-1 orbits,
- n_2 type-2 orbits.

The total number of nodes in this QR is given by

$$n = n_0 + 3n_1 + 6n_2.$$

$Q_{[0,1,0], \mathbb{P}_2}$

$Q_{[1,1,0], \mathbb{P}_3}$

$Q_{[0,2,0], \mathbb{P}_4}$

$Q_{[0,2,1], \mathbb{P}_5}$

For any $0 \leq \rho < d$, we have

$$\dim \mathbb{S}_d^\rho(T_3) = \binom{\rho+2}{2} + 3 \binom{d-\rho+1}{2} + \sum_{j=1}^{d-\rho} \max\{\rho+1-2j, 0\}.$$

It holds:

$$\#\mathbb{S}_{3r}^{2r-1}(T_3) = \#\mathbb{P}_{3r} + 2.$$

Examples:

$$\mathbb{S}_3^1(T_3) = \#\mathbb{P}_3 + 2, \quad \mathbb{S}_6^3(T_3) = \#\mathbb{P}_6 + 2, \quad \mathbb{S}_9^5(T_3) = \#\mathbb{P}_9 + 2.$$

CT-3-split: Simplex spline basis for $\mathbb{S}_3^1(T_3)$

$$\#\mathbb{S}_3^1(T_3) = \#\mathbb{P}_3 + 2$$

CT-3-split: Simplex spline basis for $\mathbb{S}_3^1(T_3)$

$$\#\mathbb{S}_3^1(T_3) = \#\mathbb{P}_3 + 2$$

- $\mathbb{P}_3 = \text{span} \left\{ \begin{array}{c} \textcircled{k+1} \\ \textcircled{i+1} \text{ --- } \textcircled{j+1} \end{array} \right\}, \quad i + j + k = 3$

CT-3-split: Simplex spline basis for $\mathbb{S}_3^1(T_3)$

$$\#\mathbb{S}_3^1(T_3) = \#\mathbb{P}_3 + 2$$

- $\mathbb{P}_3 = \text{span} \left\{ \begin{array}{c} \textcircled{k+1} \\ \textcircled{i+1} \text{---} \textcircled{j+1} \end{array} , \quad i+j+k=3 \right\}$
- Knot insertion:

$$\begin{array}{c} \textcircled{2} \\ \textcircled{2} \text{---} \textcircled{2} \end{array} = \frac{1}{3} \left(\begin{array}{c} \textcircled{2} \\ \textcircled{1} \text{---} \textcircled{2} \end{array} + \begin{array}{c} \textcircled{2} \\ \textcircled{2} \text{---} \textcircled{1} \end{array} + \begin{array}{c} \textcircled{1} \\ \textcircled{2} \text{---} \textcircled{2} \end{array} \right)$$

CT-3-split: Simplex spline basis for $\mathbb{S}_3^1(T_3)$

$$\#\mathbb{S}_3^1(T_3) = \#\mathbb{P}_3 + 2$$

- $\mathbb{P}_3 = \text{span} \left\{ \begin{array}{c} \textcircled{k+1} \\ \textcircled{i+1} \text{---} \textcircled{j+1} \end{array} , \quad i+j+k=3 \right\}$
- Knot insertion:

$$\begin{array}{c} \textcircled{2} \\ \textcircled{2} \text{---} \textcircled{2} \end{array} = \frac{1}{3} \left(\begin{array}{c} \textcircled{2} \\ \textcircled{1} \text{---} \textcircled{2} \end{array} + \begin{array}{c} \textcircled{2} \\ \textcircled{2} \text{---} \textcircled{1} \end{array} + \begin{array}{c} \textcircled{1} \\ \textcircled{2} \text{---} \textcircled{2} \end{array} \right)$$

-

$$\mathbb{S}_3^1(T_3) = \text{span} \left\{ \begin{array}{c} \textcircled{k+1} \\ \textcircled{i+1} \text{---} \textcircled{j+1} \end{array} , \quad i+j+k=3 \right\} \setminus \begin{array}{c} \textcircled{2} \\ \textcircled{2} \text{---} \textcircled{2} \end{array} \cup \left\{ \begin{array}{c} \textcircled{2} \\ \textcircled{1} \text{---} \textcircled{2} \end{array} , \begin{array}{c} \textcircled{1} \\ \textcircled{2} \text{---} \textcircled{2} \end{array} \right\}$$

CT-3-split: Simplex spline basis for $\mathbb{S}_3^1(T_3)$

Theorem

Any quadrature rule $Q_{[n_0, n_1, n_2], \mathbb{P}_3}$ is exact on the spline space $\mathbb{S}_3^1(T_3)$.

- $Q_{[n_0, n_1, n_2], \mathbb{P}_3}$ is exact on cubic polynomials

$$Q_{[n_0, n_1, n_2], \mathbb{P}_3} \left[\begin{array}{c} \text{2} \\ \text{2} \text{---} \text{1} \text{---} \text{2} \\ \text{2} \end{array} \right] = Q_{[n_0, n_1, n_2], \mathbb{P}_3} \left[\begin{array}{c} \text{2} \\ \text{1} \text{---} \text{1} \text{---} \text{2} \\ \text{2} \end{array} \right] = Q_{[n_0, n_1, n_2], \mathbb{P}_3} \left[\begin{array}{c} \text{2} \\ \text{2} \text{---} \text{1} \text{---} \text{1} \\ \text{2} \end{array} \right] =$$

$$Q_{[n_0, n_1, n_2], \mathbb{P}_3} \left[\begin{array}{c} \text{1} \\ \text{2} \text{---} \text{1} \text{---} \text{2} \\ \text{2} \end{array} \right]$$

$$\int_T \begin{array}{c} \text{2} \\ \text{2} \text{---} \text{1} \text{---} \text{2} \\ \text{2} \end{array} = \int_T \begin{array}{c} \text{2} \\ \text{1} \text{---} \text{1} \text{---} \text{2} \\ \text{2} \end{array} = \int_T \begin{array}{c} \text{2} \\ \text{2} \text{---} \text{1} \text{---} \text{1} \\ \text{2} \end{array} = \int_T \begin{array}{c} \text{1} \\ \text{2} \text{---} \text{1} \text{---} \text{2} \\ \text{2} \end{array}$$

CT-3-split: Simplex spline basis for $\mathbb{S}_{3r}^{2r-1}(T_3)$

$$\#\mathbb{S}_{3r}^{2r-1}(T_3) = \#\mathbb{P}_{3r} + 2$$

$$\mathbb{S}_{3r}^{2r-1}(T_3) = \text{span} \left\{ \begin{array}{c} \text{Diagram 1: } \begin{array}{c} \textcircled{k+1} \\ \textcircled{i+1} \text{ --- } \textcircled{j+1} \end{array}, \quad i+j+k=3r \end{array} \right\} \setminus \begin{array}{c} \text{Diagram 2: } \begin{array}{c} \textcircled{r+1} \\ \textcircled{r+1} \text{ --- } \textcircled{r+1} \end{array} \end{array} \cup \left\{ \begin{array}{c} \text{Diagram 3: } \begin{array}{c} \textcircled{r+1} \\ \textcircled{1} \\ \textcircled{r} \text{ --- } \textcircled{r+1} \end{array}, \\ \text{Diagram 4: } \begin{array}{c} \textcircled{r+1} \\ \textcircled{1} \\ \textcircled{r+1} \text{ --- } \textcircled{r} \end{array}, \\ \text{Diagram 5: } \begin{array}{c} \textcircled{r} \\ \textcircled{1} \\ \textcircled{r+1} \text{ --- } \textcircled{r+1} \end{array} \end{array} \right\}$$

Theorem

Any quadrature rule $Q_{[n_0, n_1, n_2], \mathbb{P}_{3r}}$ is exact on the spline space $\mathbb{S}_{3r}^{2r-1}(T_3)$.

For any $0 \leq \rho < d$, we have

$$\dim \mathbb{S}_d^\rho(T_6) = \binom{\rho+2}{2} + 6 \binom{d-\rho+1}{2} + \sum_{j=1}^{d-\rho} \max\{\rho+1-2j, 0\}.$$

It holds:

$$\#\mathbb{S}_{2r}^{2r-1}(T_6) = \#\mathbb{P}_{2r} + 3.$$

Examples:

$$\mathbb{S}_2^1(T_6) = \#\mathbb{P}_2 + 3, \quad \mathbb{S}_4^3(T_6) = \#\mathbb{P}_4 + 3, \quad \mathbb{S}_6^5(T_6) = \#\mathbb{P}_6 + 3.$$

PS-6-split: Simplex spline basis for $\mathbb{S}_2^1(\mathcal{T}_6)$

$$\#\mathbb{S}_2^1(\mathcal{T}_6) = \#\mathbb{P}_2 + 3$$

- $\mathbb{P}_2 = \text{span} \left\{ \begin{array}{c} \textcircled{k+1} \\ \textcircled{\quad} \textcircled{\quad} \\ \textcircled{i+1} \textcircled{\quad} \textcircled{j+1} \end{array}, \quad i+j+k=2 \right\}$

- Knot insertion:

$$\begin{array}{c} \begin{array}{c} \textcircled{1} \\ \textcircled{\quad} \textcircled{\quad} \\ \textcircled{2} \textcircled{\quad} \textcircled{2} \end{array} = \frac{1}{2} \left(\begin{array}{c} \textcircled{1} \\ \textcircled{\quad} \textcircled{\quad} \\ \textcircled{1} \textcircled{1} \textcircled{2} \end{array} + \begin{array}{c} \textcircled{1} \\ \textcircled{\quad} \textcircled{\quad} \\ \textcircled{2} \textcircled{1} \textcircled{1} \end{array} \right), \quad \begin{array}{c} \textcircled{2} \\ \textcircled{\quad} \textcircled{\quad} \\ \textcircled{1} \textcircled{\quad} \textcircled{2} \end{array} = \frac{1}{2} \left(\begin{array}{c} \textcircled{2} \\ \textcircled{\quad} \textcircled{1} \\ \textcircled{1} \textcircled{\quad} \textcircled{1} \end{array} + \begin{array}{c} \textcircled{1} \\ \textcircled{\quad} \textcircled{1} \\ \textcircled{1} \textcircled{\quad} \textcircled{2} \end{array} \right) \\ \\ \begin{array}{c} \textcircled{2} \\ \textcircled{\quad} \textcircled{\quad} \\ \textcircled{2} \textcircled{\quad} \textcircled{1} \end{array} = \frac{1}{2} \left(\begin{array}{c} \textcircled{2} \\ \textcircled{1} \textcircled{\quad} \\ \textcircled{1} \textcircled{\quad} \textcircled{1} \end{array} + \begin{array}{c} \textcircled{1} \\ \textcircled{1} \textcircled{\quad} \\ \textcircled{2} \textcircled{\quad} \textcircled{1} \end{array} \right) \end{array}$$

PS-6-split: Simplex spline basis for $\mathbb{S}_2^1(T_6)$

$$\#\mathbb{S}_2^1(T_6) = \#\mathbb{P}_2 + 3$$

$$\mathbb{S}_2^1(T_6) = \text{span} \left\{ \begin{array}{c} k+1 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ i+1 \quad j+1 \end{array} , \quad i+j+k=2 \right\} \setminus \left\{ \begin{array}{c} 1 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 2 \quad 2 \end{array} , \begin{array}{c} 2 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 1 \quad 2 \end{array} , \begin{array}{c} 2 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 2 \quad 1 \end{array} \right\}$$

$$\cup \left\{ \begin{array}{c} 1 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 1 \quad 1 \quad 2 \end{array} , \begin{array}{c} 1 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 2 \quad 1 \quad 1 \end{array} , \begin{array}{c} 2 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 1 \quad \bullet \quad 1 \end{array} , \begin{array}{c} 1 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 1 \quad \bullet \quad 2 \end{array} , \begin{array}{c} 2 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 1 \quad \bullet \quad 1 \end{array} , \begin{array}{c} 1 \\ \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ 2 \quad \bullet \quad 1 \end{array} \right\}$$

Theorem

Any quadrature rule $Q_{[n_0, n_1, n_2], \mathbb{P}_2}$ is exact on the spline space $\mathbb{S}_2^1(T_6)$.

- $Q_{[n_0, n_1, n_2], \mathbb{P}_2}$ is exact on quadratic polynomials

$$\bullet \quad Q_{[n_0, n_1, n_2], \mathbb{P}_2} \left[\begin{array}{c} 1 \\ \bullet \quad \bullet \\ 2 \quad \bullet \quad 2 \end{array} \right] = Q_{[n_0, n_1, n_2], \mathbb{P}_2} \left[\begin{array}{c} 1 \\ \bullet \quad \bullet \\ 1 \quad 1 \quad 2 \end{array} \right] = Q_{[n_0, n_1, n_2], \mathbb{P}_2} \left[\begin{array}{c} 1 \\ \bullet \quad \bullet \\ 2 \quad 1 \quad 1 \end{array} \right]$$

$$\bullet \quad \int_T \begin{array}{c} 1 \\ \bullet \quad \bullet \\ 2 \quad \bullet \quad 2 \end{array} = \int_T \begin{array}{c} 1 \\ \bullet \quad \bullet \\ 1 \quad 1 \quad 2 \end{array} = \int_T \begin{array}{c} 1 \\ \bullet \quad \bullet \\ 2 \quad 1 \quad 1 \end{array}$$

PS-6-split: Simplex spline basis for $\mathbb{S}_{2r}^{2r-1}(T_6)$

$$\#\mathbb{S}_{2r}^{2r-1}(T_6) = \#\mathbb{P}_{2r} + 3$$

$$\mathbb{S}_2^1(T_6) = \text{span} \left\{ \begin{array}{c} \textcircled{r+1} \\ \textcircled{r+1} \textcircled{r+1} \\ \textcircled{i+1} \textcircled{j+1} \textcircled{k+1} \end{array}, i+j+k=2r \right\} \setminus \left\{ \begin{array}{c} \textcircled{1} \\ \textcircled{r+1} \textcircled{r+1} \\ \textcircled{r+1} \textcircled{r+1} \textcircled{r+1} \end{array}, \begin{array}{c} \textcircled{r+1} \\ \textcircled{1} \textcircled{r+1} \\ \textcircled{r+1} \textcircled{1} \textcircled{r+1} \end{array}, \begin{array}{c} \textcircled{r+1} \\ \textcircled{r+1} \textcircled{r+1} \\ \textcircled{r+1} \textcircled{1} \textcircled{1} \end{array} \right\} \\ \cup \left\{ \begin{array}{c} \textcircled{1} \\ \textcircled{r} \textcircled{1} \textcircled{r+1} \\ \textcircled{r} \textcircled{1} \textcircled{r+1} \end{array}, \begin{array}{c} \textcircled{1} \\ \textcircled{r+1} \textcircled{1} \textcircled{r} \\ \textcircled{r+1} \textcircled{1} \textcircled{r} \end{array}, \begin{array}{c} \textcircled{r+1} \\ \textcircled{1} \textcircled{r} \textcircled{r} \\ \textcircled{1} \textcircled{r} \textcircled{r} \end{array}, \begin{array}{c} \textcircled{r} \\ \textcircled{1} \textcircled{r+1} \textcircled{r+1} \\ \textcircled{1} \textcircled{r+1} \textcircled{r+1} \end{array}, \begin{array}{c} \textcircled{r+1} \\ \textcircled{r} \textcircled{1} \textcircled{1} \\ \textcircled{r} \textcircled{1} \textcircled{1} \end{array}, \begin{array}{c} \textcircled{r} \\ \textcircled{r+1} \textcircled{1} \textcircled{1} \\ \textcircled{r+1} \textcircled{1} \textcircled{1} \end{array} \right\}$$

Theorem

Any quadrature rule $Q_{[n_0, n_1, n_2], \mathbb{P}_{2r}}$ is exact on the spline space $\mathbb{S}_{2r}^{2r-1}(T_6)$.

Could we apply similar techniques to trivariate splines?

Symmetric quadrature rules in \mathbb{R}^3

If $t(\alpha_1, \alpha_2, \alpha_3, \alpha_4)$ is a node of $\mathcal{Q}_{n, \mathbb{S}}$ with the corresponding weight ω , then for every permutation Π of $(\alpha_1, \alpha_2, \alpha_3, \alpha_4)$, the node $t_{\Pi}(\Pi(\alpha_1, \alpha_2, \alpha_3, \alpha_4))$ is also a node of $\mathcal{Q}_{n, \mathbb{S}}$ with the same weight ω .

- type-0-orbit $t(1/4, 1/4, 1/4, 1/4)$
- type-1-orbit $t(1 - 3\alpha, \alpha, \alpha, \alpha)$
- type-2-orbit $t(1 - 2\alpha - \beta, \beta, \alpha, \alpha)$
- type-3-orbit $t(\alpha, \beta, \gamma, \delta = 1 - \alpha - \beta - \gamma)$ ($\alpha \neq \beta \neq \gamma \neq \delta$)

Macro-element splines

Let T_ℓ be a split of a tetrahedra $T = \langle p_1, p_2, p_3, p_4 \rangle$ into ℓ sub-tetrahedra. The spline space of trivariate global smoothness r and degree d is defined as:

$$\mathbb{S}_d^r(T_\ell) := \{s \in C^r(T); s|_\Delta \in \mathbb{P}_d \quad \forall \Delta \in T_\ell\}$$

AL-4-split (Alfeld
1984)

$$\#\mathbb{S}_4^1(T_4) = \#\mathbb{P}_4 + 3$$

FW-12-split (Farin
Worsey 1987)

$$\#\mathbb{S}_3^1(T_{12}) = \#\mathbb{P}_3 + 8$$

WP-24-split

(Worsey-Piper 1988)

$$\#\mathbb{S}_2^1(T_{24}) = \#\mathbb{P}_2 + 6$$

Theorem

- Any quadrature rule $Q_{[n_0, n_1, n_2, n_3], \mathbb{P}_4}$ is exact on the spline space $\mathbb{S}_4^1(T_4)$ (Alfeld).
- Any quadrature rule $Q_{[n_0, n_1, n_2, n_3], \mathbb{P}_3}$ is exact on the spline space $\mathbb{S}_3^1(T_{12})$ (Farin-Worsey).
- Any quadrature rule $Q_{[n_0, n_1, n_2, n_3], \mathbb{P}_2}$ is exact on the spline space $\mathbb{S}_2^1(T_{24})$ (Worsey-Piper).

Theorem

- Any quadrature rule $Q_{[n_0, n_1, n_2, n_3], \mathbb{P}_4}$ is exact on the spline space $\mathbb{S}_4^1(T_4)$ (Alfeld).
- Any quadrature rule $Q_{[n_0, n_1, n_2, n_3], \mathbb{P}_3}$ is exact on the spline space $\mathbb{S}_3^1(T_{12})$ (Farin-Worsey).
- Any quadrature rule $Q_{[n_0, n_1, n_2, n_3], \mathbb{P}_2}$ is exact on the spline space $\mathbb{S}_2^1(T_{24})$ (Worsey-Piper).

Thank you
